  mirrors

• BMC mirrors in the field

### **Testing current mirrors**

#### Contract#: NNH12CQ27C TDEM/ROSES MEMS Deformable Mirror Technology Development for Space-Based Exoplanet Detection

Objective: Demonstrate survivability of the BMC MEMS Deformable Mirror after exposure to dynamic mechanical environments close to those expected in space based coronagraph launch.

#### 9 Mirrors ready for testing

5cm

## Exploratory Vibration Testing

Low, medium and high levels tested on test sample in X, Y, and Z

## Exploratory Vibration Testing

#### Before

- Visual testing after Low Level
- Visual and Functional testing after Medium and High level
- All die attach and wirebonds held
- No change in unpowered and powered surface finish
- No change in electromechanical performance (yield and voltage v. deflection)

 $PV = 0.659 \ \mu m$ RMS = 0.163 \ \ \ m

 $\begin{array}{ll} PV = & 0.636 \; \mu m \\ RMS = \; 0.162 \; \mu m \end{array}$

### Conclusion

- Testing is ongoing with our TDEM program. Parts are finally about to ship to JPL, Princeton, and Goddard for testing.
- Improvements our current designs show good promise for built in redundant protection for space based imaging.
- Topographic improvements to our processes are currently being integrated into our heritage fabrication process.
- Demonstrated feasibility of up to 1mm pitch MEMS mirrors and showed lower actuation voltages are possible by using thinner films.

### Topography Improvement Program Objectives

- Reduce Scalloping
- Reduce Print Through
- Deliver a 3064 actuator continuous facesheet mirror

#### The presence of the diffraction peaks in the image plane creates optical problems:

- Local blind spots in the image plane
- Extended light leak from diffraction peaks across the image plane
- Chromaticity of the diffraction orders

![](_page_31_Figure_9.jpeg)

### **Topography Improvement Results** Scalloping Reduction

A voltage versus deflection curve of an actuator.

![](_page_34_Figure_4.jpeg)

### Voltage deflection results from Phase I

![](_page_34_Figure_6.jpeg)

Electro-Mechanical Performance Comparison of Baseline DM Actuator

35

### Reduction of Snap-Through Related Damage

![](_page_35_Picture_1.jpeg)

- In Phase I the addition of current limiting elements further increases overall MEMS DM reliability
- Reducing high-current densities at snap-through

![](_page_35_Picture_4.jpeg)

#### Electrode Without Current Limiting Electronics

![](_page_35_Picture_6.jpeg)

Electrode with Current Limiting Electronics

![](_page_35_Picture_8.jpeg)

## Current-limiting Resistor Boards

![](_page_36_Picture_1.jpeg)

- Current-limiting resistor board with a 390 MOhm resistor inline for all channels has been fabricated and is being tested
- Trade off is reduced bandwidth

![](_page_36_Picture_4.jpeg)

#### Comparison of Voltage vs. Deflection Curves of a 4x4 Actuator Array

![](_page_36_Figure_6.jpeg)

![](_page_37_Picture_0.jpeg)

### Before and After Testing Characterization

- Topographic surface maps of aperture
- Topographic surface maps over 600µm subapertures
- Voltage v. Deflection and influence function
- Stability
- Repeatability
- Imposing known surfaces on the mirror surface at multiple offsets.

![](_page_37_Figure_8.jpeg)

![](_page_37_Figure_9.jpeg)

Test performed at BMC using Zygo Verifire laser Fizeau interferometer Repeated at JPL Vacuum Surface Gauge for higher resolution measurements

Attach die to a ceramic package and wirebond

# High Contrast Imaging Laboratory (HCIL) at Princeton University

- Test the performance of two DMs in series with a shaped pupil coronagraph in both monochromatic and broadband (10% and 20%) light
- For each test the resulting voltage map on the DM will be recorded and used as a base line for future testing.

![](_page_39_Figure_3.jpeg)

## Environmental Testing at GSFC

![](_page_40_Picture_1.jpeg)

![](_page_40_Picture_2.jpeg)

![](_page_40_Picture_3.jpeg)

#### Vibration Random and Sinusoidal

#### Acoustic

#### Shock

Previous environmental testing (Thermal, acoustic, and vibration) performed at JAXA

![](_page_41_Picture_0.jpeg)

## **Current Project Status**

- Fabrication of MEMS Mirrors ongoing
- Automated testing procedure completed
  - Many measurements taken automatically
  - Long duration (over night)
- Coordination with JPL on testing
  - Test procedures
  - Drive electronics
  - Mirror Mount

![](_page_42_Picture_0.jpeg)

## **DM Fabrication Run**

- One 2048 poly 1 send-ahead actuator array device was packaged and wirebond with Xwire, insulated Au wire.
- Electromechanical performance has been verified by performing voltage versus deflection on a single actuator
- Snap-through tolerance testing will be performed by cycling actuators from 0V to maximum voltage of the driver

#### Packaged Send-Ahead device

![](_page_42_Picture_6.jpeg)

Enhanced Reliability Actuator Design

![](_page_43_Picture_4.jpeg)

Electro-Mechanical Performance Comparison of Baseline DM Actuator and Enhanced Reliability DM Actuator Designs

![](_page_43_Figure_6.jpeg)

### Prevention of Snap-Through Related Damage

![](_page_44_Picture_1.jpeg)

- Addition of current limiting elements further increases overall MEMS DM reliability
  - Eliminates high-current densities at snap-through

#### Without Current Limiting electronics

![](_page_44_Picture_5.jpeg)

![](_page_44_Picture_6.jpeg)

With Current Limiting electronics

![](_page_44_Picture_8.jpeg)

### **Topography Improvement Work Remaining**

- Complete fabrication process
- mount the DM in a ceramic carrier, make the electrical interconnections using high density gold wire bonding techniques
- Assemble the component into an optical mount.
- Characterize optical quality and electromechanical DM performance.

![](_page_45_Picture_5.jpeg)

## Environmental Testing Performed on BMC's Deformable mirrors

Prepared for: DM Environmental Testing 2<sup>nd</sup> Teleconference September 11, 2012 By: Paul Bierden Steven Cornelissen

![](_page_49_Picture_0.jpeg)

## Outline

### Testing Performed

- Thermal
- Vibration
- Acoustic
- Rapid Pump
- Radiation
- Future Work

![](_page_50_Picture_0.jpeg)

## **Thermal Testing**

- DM: Multi-DM with custom package
- Date: 2008
- Location: JAXA
- Pressure: ~10<sup>-6</sup> torr
- Test:
  - 95K exposure and operation
- See publication:

"A Micro Electrical Mechanical Systems (MEMS)-based Cryogenic Deformable Mirror," Enya, K.; Kataza, H.; Bierden, P., Publications of the Astronomical Society of the Pacific, Volume 121, issue 877, pp.260–265

![](_page_51_Picture_0.jpeg)

## **Thermal Testing Results**

#### Voltage deflection measurements

![](_page_51_Figure_3.jpeg)

![](_page_52_Picture_0.jpeg)

### Thermal Testing Results Interferometric 3D surface data

![](_page_52_Figure_2.jpeg)

All data were obtained by measurements made through the window of the vacuum cryostat.

- (a) Surface without voltage applied at room temperature.
- (b) Surface without voltage applied at 95 K.
- (c) Surface with 50V on the 13th CH at 95 K.
- (d) Surface with 80V on the 13th CH at 95 K.

The difference between (a) and (b) is much smaller than the deformation caused by the voltage applied.

![](_page_53_Picture_0.jpeg)

## **Vibration Testing**

- DM: Mini–DM with window
- Temperature: ambient
- Pressure: 1atm
- Date: Feb. 14th, 2011
- Performed by: ISAS/JAXA
- Test sequence:
  - Zygo inspection
  - Vibration sequence ->Zygo inspection
  - Heavier vibration sequence ->Zygo inspection
- Vibration levels: -12dB, -6dB, -3dB, 0dB, +3dB
- Direction of the vibration: Vertical direction from DM surface.
- Time of each vibration load: 60 sec.
- Conclusion:

No significant changes found during inspection

![](_page_53_Picture_16.jpeg)

#### **OdB Vibration Profiles**

| Frequency<br>(Hz) | PSD<br>(G^2/Hz) |
|-------------------|-----------------|
| 20                | 4.3             |
| 80                | 67.3            |
| 270               | 67.3            |
| 413               | 28.9            |
| 800               | 28.9            |
| 2000              | 2.5             |
| Over all          | 21.1 Grms       |

![](_page_54_Picture_0.jpeg)

## Vibration Testing (2)

<u>PICTURE project payload was shake tested</u> with the DM in place

- DM: Kilo DM
- Performed at: Wallops Flight Facility
- Test sequence: NASA Vehicle Level 2 levels
- Spectrum:

12.7gms 0.01g2/Hz 20Hz 0.10g2/Hz 1000Hz (on 1.8bd/oct slope) 0.10g2/Hz 1000-2000Hz

- Direction of the vibration: 3 axes
- Time of each vibration load: 10 sec/axes
- Conclusion: The DM was tested successfully after being shaken within the full payload

![](_page_55_Picture_0.jpeg)

## **Acoustic Testing**

- DM: Mini–DM w/ window
- Temperature: ambient
- Pressure: 1atm
- Date: Feb. 3th, 2011
- Performed by: Tsukuba Space Center/JAXA
- Acoustic level: See table
- Time of acoustic load:
  - 60(+2-0) second
- Test sequence:
  - Zygo inspection (actuator yield inspection)
  - Acoustic load in TSC
  - Zygo inspection

#### Conclusion:

 No significant changes found during inspection

![](_page_55_Picture_16.jpeg)

| 1/1oct center<br>frequency | Acoustic<br>pressure (dB) | Tolerance  |
|----------------------------|---------------------------|------------|
| 31.5                       | 128.0                     | +5/-10  dB |
| 63                         | 135.0                     | +- 3dB     |
| 125                        | 139.6                     | +- 3dB     |
| 250                        | 138.0                     | +- 3dB     |
| 500                        | 135.0                     | +- 3dB     |
| 1000                       | 132.0                     | +- 3dB     |
| 2000                       | 129.0                     | +- 3dB     |
| 4000                       | 124.0                     | +3- 10dB   |
| 8000                       | 118.0                     | +- 6dB     |
| Over all                   | 144.0                     | +- 2dB     |

\* 0dB=2x10<sup>-5</sup>[Pa]

![](_page_56_Picture_0.jpeg)

## **Rapid Pumping Testing**

- DM: Mini–DM, no window
- Temperature: ambient
- Date: June 7th , 2011
- Performed by: ISAS/JAXA
- Test sequence:
  - Pumping sequence
  - Deformability check
  - Repeat
- Pumping profile #10 is more rapid than the expected pressure profile of H IIA rocket fairing at any pressure.
- Conclusion:
  - No significant changes found during inspection

H IIA rocket fairing internal pressure

![](_page_56_Figure_14.jpeg)

![](_page_56_Figure_15.jpeg)

![](_page_57_Picture_0.jpeg)

## Radiation Exposure Testing

- DM: 1.5um stroke DM
- Temperature: ambient
- Date: 2003
- Performed by: JPL High Dose Rate (HDR) facility
- Test sequence:
  - Used cobalt-60 gamma rays up to 3Mrad.
  - Two groups with five mirror actuators each, all located on a single device.
  - One group of segments irradiated without bias (electrodes at ground),
  - One group irradiated with a deflection voltage of 140 volts.
  - Device removed after each exposure, run temporarily removing bias from the segments that were biased, and measured with a Wyko model RST Plus Optical Profiler.
- Conclusion:
  - Deflection data for both of the test groups indicated no significant effects

![](_page_57_Figure_14.jpeg)

Change in mirror deflection due to radiation for biased segments.

## FutureTesting

- Testing of MEMS DMs
  - Surface finish (unpowered and actively flattened)
  - Actuator yield
  - Voltage v. Deflection
  - Influence function
  - Frequency response
- Characterize at BMC and test beds
  - JPL APEP test bed/HCIT
  - GSFC VNT
  - Princeton University HCIL
- Environmental testing at GSFC's Environmental Test and Integration Facilities (ETIF)
  - Vibration
  - Acoustic
  - Thermal
- TDEM program not started
